Key indicators: single-crystal X-ray study;  $T = 223\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.045;  $wR$  factor = 0.125; data-to-parameter ratio = 8.7.

The crystal structure of the title compound,  $C_{27}\text{H}_{45}\text{N}_3$ , has been determined as part of our investigation into the hydrophobic modification of aminoglycoside antibiotics. The isopropyl group showed disorder for the tertiary carbon (equal occupancies), with high thermal motion for the peripheral atoms of the isopropyl and azide groups also apparent in the structure. The axial disposition of the azide group is consistent with the clean inversion of stereochemistry at C-3 under Mitsunobu conditions.

### **3 $\alpha$ -Azido-5-cholestene**

#### **Comment**

As part of our program to identify new anti-tubercular compounds, we have created a diverse range of azide and alkyne coupling partners to generate a variety of compounds (Quader *et al.*, 2007; Wilkinson *et al.*, 2007). Among these are steroid and lipid components for the hydrophobic modification of aminoglycosides to aid in penetration of the waxy coat of mycobacteria (Quader *et al.*, 2006). Here, we describe the synthesis and X-ray crystal structure of 3 $\alpha$ -azido-5-cholestene, (II, Fig. 1). This compound was previously tested for its ability to inhibit cholesterol biosynthesis (Stoffel *et al.*, 1978).

Compound (II) was synthesized directly from cholesterol (I) in 74% yield using the Mitsunobu reaction catalysed with the zinc azide-pyridine complex  $[\text{Zn}(\text{N}_3)_2(\text{py})_2]$  (Viaud & Rollin, 1990). This reaction compares favourably with the use of toxic  $\text{HN}_3$  for this purpose (Loibner & Zbiral, 1976). The clean inversion of stereochemistry under these conditions makes this method preferable in both efficiency and selectivity over azide displacement of 3-tosylate (Freiberg, 1965). A competing reaction at C-6 and a mixture of isomers at C-3 was reported in the latter case.

Compound (II) crystallizes in the polar space group  $P2_1$  with one molecule in the asymmetric unit. The fused tetracyclic ring system adopts the expected conformations for the all-trans A/B/C/D junctions. The six-membered rings A and C adopt normal chair conformations. The C5—C6 bond length of 1.320 (4) $\text{\AA}$  confirms the presence of the double bond in this position while the axial disposition of the azide substituent on C3 confirms inversion of the alcohol stereochemistry has occurred. The azide group is almost linear with the N31—N32—N33 angle 173.4 (5) $^\circ$  while the C3—N31—N32 angle is 115.4 (4) $^\circ$ . The molecules are linked in the crystal lattice by van der Waals interactions only.

#### **Experimental**

Diisopropyl azodicarboxylate (DIAD) (520  $\mu\text{L}$ , 2.58 mmol) was slowly added to a suspension of cholesterol (I) (500 mg, 1.29 mmol), triphenylphosphine (676 mg, 2.58 mmol) and  $[\text{Zn}(\text{N}_3)_2(\text{py})_2]$  (Viand & Rollin, 1990) (400 mg, 1.29 mmol) in toluene at RT and stirred (4 h). The reaction mixture was then concentrated under reduced pressure and subjected to column chromatography to furnish 3 $\alpha$ -azido-5-cholestene as a pale-yellow solid (394 mg, 74%). Crystals suitable for X-ray diffraction analysis, were obtained after recrystallization from  $\text{CDCl}_3$ : mp 387–389 K [lit. mp 388–389 K (Freiberg, 1965)].

## Refinement

H atoms attached to carbon were constrained as riding atoms, with C–H set to 0.93 - 0.97 Å.  $U_{\text{iso}}(\text{H})$  values were set to 1.2 $U_{\text{eq}}$  of the parent atom. The isopropyl group showed disorder with the C25 atom modelled as two atoms with 50% occupancy. High thermal motion of peripheral carbon atoms (C26, C27) for the isopropyl group and the nitrogen atom N33 of the azide group was also apparent in the structure. In the absence of significant anomalous dispersion effects, Friedel pairs were merged before refinement. The absolute configuration was assigned on the basis of the C atoms retaining their configuration during the synthesis of the azide.

### Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
