Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. In 2007, the journal published over 5000 structures. The average publication time is less than one month.

Received 1 September 2010; accepted 2 September 2010

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.030; wR factor = 0.070; data-to-parameter ratio = 13.6.

The title compound, $C_{15}H_{14}\text{ClNO}_2$, was synthesized as part of a project to generate a combinatorial library based on the fungal natural product 2-(3-chloro-4-hydroxyphenyl)-acetamide. It crystallizes as non-planar discrete molecules [the peripheral 3-chloro-4-hydroxyphenyl and benzyl groups are twisted out of the plane of the central acetamide group, with $\text{N}-\text{C}-\text{C}-\text{C}$ and $\text{C}-\text{C}-\text{C}-\text{C}$ torsion angles of $-58.8(3)$ and $65.0(2)^\circ$, respectively] linked by intermolecular $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds.

N-Benzyl-2-(3-chloro-4-hydroxyphenyl)acetamide

R. A. Davis and P. C. Healy

Comment

The title compound (**I**) (Fig. 1) was synthesized during the generation of a combinatorial library based on the fungal natural product 3-chloro-4-hydroxyphenylacetamide and was shown to display moderate cytotoxicity towards the human melanoma cell line MM96L and the human prostate cell line DU145 with IC₅₀ values of 72 and 51 µM respectively (Davis *et al.*, 2007). Although many organohalogen natural products have been identified (Gribble, 1996), only three crystal structures on compounds incorporating the 3-chloro-4-hydroxyphenylacetamide moiety have been reported to date (Krohn *et al.*, 1992; Davis *et al.*, 2005; Davis & Healy, 2008).

The present compound crystallizes in the chiral space group *P*2₁ as discrete molecules with the central C1—C7—C8(-O8)-N1—C9—C10 fragment approximately planar. The peripheral 3-chloro-4-hydroxyphenyl (C1—C7, O4, Cl3) and benzyl (C9—C15) groups are twisted out of the plane of the central acetamide group with N1—C9—C10—C11 and C2—C1—C7—C8 torsion angles of -58.8 (3) and 65.0 (2) °, respectively (Fig. 1). In the crystal lattice the amide (N1) and hydroxy (O4) groups form inter-molecular N—H···O and O—H···O hydrogen bonds with the carbonyl O atoms (O8) at (1 + *x*, *y*, *z*) and (-*x* - 1, *y* + 1/2, 1 - *z*), respectively (Table 1 & Fig. 2).

Experimental

Compound (**I**) was prepared and analytically and spectroscopically characterized as previously reported (Davis *et al.*, 2007; Poulsen *et al.*, 2006). Crystals suitable for X-ray diffraction studies were obtained by recrystallization from a solution of the compound in a solvent mix of 90% methanol, 10% water, and 0.1% trifluoroacetic acid.

Refinement

The carbon-bound H atoms were constrained as riding atoms with C—H = 0.93–0.96 Å. The amide and hydroxyl protons were located in difference Fourier maps and constrained with N—H 0.86 Å and O—H = 0.90 Å in the final refinement. *U*_{iso}(H) values were set at 1.2*U*_{eq} of the parent atom.

Figures

Fig. 1. View of (**I**) with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level.

Primary atom site location: structure-invariant direct Flack parameter: -0.11 (6)
methods

Special details

Experimental. CrysAlisPro (Oxford Diffraction, 2010). Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement on F^2 for ALL reflections except those flagged by the user for potential systematic errors. Weighted R -factors wR and all goodnesses of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The observed criterion of $F^2 > \sigma(F^2)$ is used only for calculating $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
