

## Studio Research ‘Shrunk to this Little Measure?’

*Professor Ross Woodrow  
Queensland College of Art, Griffith University*

### Introduction

The Excellence in Research for Australia (ERA) process has proved a very useful exercise for academics working in the creative fields. Individuals producing non-traditional research outputs such as exhibitions, film and performance have been asked, often for the first time, to describe the background, context and significance of their research. This also offers the opportunity to examine how curators and artists working in various mediums describe their research. What follows is a comparative analysis of sixty-five ERA research statements from one institution with sixty-five randomly selected science abstracts from peer-reviewed journals in the fields of biological, environmental and health sciences along with applied physics and chemistry.

Since the beginning of debate around the creative arts as research in Australia in the mid-1990s, I have often heard the claim made that the studio as a site for research in academe most resembles the science laboratory. I generally agreed with this proposition, based on the historical precedent of the seventeenth-century Dutch artist, exemplified by Vermeer and Pieter Janssen, who used their studios as sites for experimentation with light and lenses and the model of the Italian Renaissance artist who Gombrich would claim ‘works like a scientist [whose] works exist not only for their own sake but also to demonstrate certain problem-solutions’ (Alpers in Jones and Galison, 1998, p.416). And because of these claims, I was prompted to take the opportunity offered by the ERA to explore what correspondence exists between the terms that artists and scientists use to describe their research. Given the size of my available sample I realised from the beginning that it is too small to make definitive judgments. However, because the samples are certainly large enough to indicate any significant differences between the two broad disciplines represented, I have also chosen a basic concordance methodology to highlight any potential correspondences and differences in the use of key words associated with description of modes of operation and outcomes of research in each of the broad fields of art and science.

In linguistics and the social sciences generally, concordance theory has been used as a quantitative instrument to give the validity of replicability to the analysis of texts and discourse. I am not following either of these disciplines in claiming any rigid structuralist analysis of the sample texts. Instead I am offering a preliminary qualitative assessment of the significant divergence, the quantitative concordance sampling has revealed in how artists and scientists describe their research. Most importantly the outcome of this pilot investigation indicates the need for a larger study using the data now collected from across all universities by the Australian Research Council (ARC) in the ERA process.

### **Scope and Method**

For ERA 2010, Research Statements were required for all non-traditional outputs submitted for peer review and the ARC stipulated the format of the statements. The full specifications were given with an example as 'Appendix D' of the *ERA 2010 Submission Guidelines* published by the Commonwealth Government (available online: [www.arc.gov.au/era/](http://www.arc.gov.au/era/)). The following summary will suffice to indicate the matrix that was dictated for the statement.

The statement must be around 250 words (no more than 2000 characters) and address the following categories:

1. Research Background

Field

Context

Research Question

2. Research Contribution

Innovation

New Knowledge

3. Research Significance

Evidence of Excellence (77)

For the purposes of the ERA, non-traditional outputs were divided into three groupings, with various subcategories. These were:

1. *Original Creative Works*: Visual art work, Design/Architectural work, textural work (including catalogue essays) and Other.
2. *Curated or Produced Substantial Public Exhibitions and Events* (this is where the curator is not the producer of the work)

### 3. *Recorded/Rendered Creative Works*: Film/Video, Performance, Inter-arts, Website/Web exhibition and Other.

The sixty-five ERA research statements chosen for this sample were all from the ERA Field of Research (FoR) 1902 and 1905, *Film, Television and New Media* and *Visual Arts and Crafts* respectively. The three broad groups 1, 2 and 3 above are included, however there are no statements representing Design, Architectural work or Performance. *Original Creative Visual Art Work* dominates the sample. The statements have been de-identified with the removal of individual's names when they appear in the concordance text strings along with removal of titles of exhibitions or works that would identify the artist. Proper names have also been expunged from the full concordance listing for the combined research statements. It should also be noted that in cases where artists introduced the subsections of their statements with headings such as "Research Question" or "New Knowledge" these were not included in the concordance document.

The full-text concordance for the collected ERA visual art research statements and the science abstracts are presented as Appendix 3 and Appendix 4 respectively. No words have been suppressed in each search but all the data has been treated as lower case to help compress the ranking. The concordance program used is *AntCon* developed in 2007 by Laurence Anthony at the School of Science and Engineering, Waseda University, Tokyo, Japan.

As noted above, research statements for the ERA were limited to 2000 characters and each of the sixty-five statements in this sample are around 240 words making a total count of 16,051 words for the analysis document. There is considerable variation in the word length of the sixty-five randomly selected science abstracts with a limited number over 250 words but the majority are in the order of 100 words in length. As a result, the total word count for the analysis document is only 8,296 words, or slightly over half the word count of the visual art statement document. This difference should not make a significant impact on the comparative concordance analysis since my aim is to find descriptive terms related to the operational modes and outcomes or significance of the research in each case and a condensation of any abstract, or research statement, would by necessity contain the key terms relevant to such analysis.

As is revealed by the Key Word In Context (KWIC) charts, Appendix 1 & 2, most key words were searched in all their forms of regular expression or using the “REGEX” program option.

## Findings

The personal pronoun ‘I’ and ‘my’ are missing from both the science and visual art statements whereas Darwin’s *Origin of Species* contains almost 1000 uses of ‘I’, 149 uses of ‘my’ and 151 uses of ‘me’. Darwin also used ‘we’ 1155 times in the *Origin* and although ‘we’ is one of the words suppressed in the concordance it is clear that he used this in a general collective sense.

In the science abstracts ‘we’ occurs fifteen times in eight abstracts, or 12% of the total, and in every case it signifies the specific group of authors of the article or report. The fact that only five of the sixty-five science abstracts are by single authors explains the lack of the personal pronoun ‘I’ as it explains the way collaborative research in science has developed since the nineteenth century when Darwin was working. The majority of the articles in the science sample are by multiple rather than dual authors. While research teams are the norm in science, the opposite is usually the case in the visual arts where outputs are generally created by individuals. Almost all the visual arts outputs in this sample of sixty five were by individual artists, writers or curators. However, it is important to note that for the sake of stylistic conformity the research statements in the sample were all edited to read in the third person, even though many of the original statements were written in the first person. With the hindsight offered by this comparison it may have been more appropriate to retain the first person register in the visual arts research statements.

Descriptions of research in science and visual art do correspond on a number of terms but in every case the correlation is weak. Where science and visual art differ in descriptions of research the divergence is strong. The following table makes this evident (Table 1).

**Table 1**

	Science usage	Visual Art usage
Analysis	37	1
Aesthetics	0	16
Comparison	16	1

Contest	0	1
Create	0	31
Critique	0	11
Demonstrate	5	15
Describe	3	0
Determine	14	1
Explore	0	23
Expression	2	8
Inquiry	0	1
Insight	0	3
Interpret	1	4
Investigate	12	8
Knowledge	1	4
Metaphor	0	8
Method	24	16
Model	17	2
Observed	13	1
Poetic	0	2
Provoke	0	2
Show	20	11
Study	26	7
Suggest	7	0
Understanding	3	26
Value	8	14

Many of the differences are amplified when this table is read in conjunction with the KWIC charts (Appendix 1 & 2). For example, 'show' is mostly used as a noun in the visual art extracts but exclusively as a verb in the science abstracts. Similarly, 'value' in the science abstracts refers exclusively to specific scales or degrees of measure while in the visual art extracts it takes a more relaxed or general sense of quality.

The tentative indications from this small study suggest that visual art research and experimental science are not closely related, despite the abiding claim that studio

research most approaches the model of research in the science laboratory. The results do however mostly confirm the existing images of the distinctive operations of art and science. Scientists analyse, investigate, observe, determine, compare, and study by using or constructing methods and models. Artists create, critique, explore, interpret, express insights and increase our understanding.

Most interesting are the distinctions that are anomalous or in contrast to the usual stereotype of scientist or artist. For example, 'observation' has traditionally been the province of the artist and scientist but this result suggests such activity is the primary preserve of the scientist and obviously needs further scrutiny. This is particularly so considering the work by Peter Galison and Lorraine Daston, among others, in demonstrating the very subjective nature of 'observation' in science when it relates to image making and analysis, with scientists often working 'in a space that is at once scientific and artistic' (Daston & Galison, 2007, p.412; see also Elkins, 1999, esp. p.8-51). In relation to the use of digital images in science for modelling and analysis, Daston and Galison have suggested that:

At this point, the relationship of science to aesthetics has departed from all our earlier models. Art and science are not self-evidently a single enterprise (few today assume that the True and the Beautiful must necessarily converge), nor do they stand in stalwart opposition to each other. Instead, they uneasily but productively reinforce each other in a few borderline areas (2007, p.412).

Also unexpectedly, the artist rather than the scientist seems to take the role of 'demonstrating' a result or outcome and even more perplexing, 'knowledge' in this sample rests decidedly in the visual arts research, although the numbers are impossibly small. It is also interesting that 'invention' and 'discovery' in any form do not appear in the science or visual art texts.

What is most clearly indicated in this pilot study is that the characteristic feature of visual arts research is its contribution to advancing understanding. Indeed the distinction between the degree of the use 'understanding' in science and art is large and the twenty-one instances in the visual art statements also measure substantially above general or specialist usage. For example in the Leeds University English Internet Corpus of 110 million words the frequency of 'understanding' is 29.23 times per million words (<http://corpus.leeds.ac.uk/list.html>). In Darwin's *Origin of Species*, 'understanding' only occurs nine times and the cluster 'understanding of' does not occur at all in the 153,773 words of the text (Barrett et. al., 1981, p.774).

**Table 2**

### **Speculative Conclusions**

The absence of ‘signify’, ‘denotes’ or ‘connotation’ and the regular expressions associated with each in the art statements might be seen as evidence for the demise of the semiotic paradigm but I would not attempt such a claim since from my experience artists have rarely ever used mechanistic semiotic descriptors for their work.

In recent years there has been an increasing interest by art historians in bringing the new knowledge developed in neuroscience into understanding the operation of art. John Onians has both outlined the scope of these recent studies and identified a historical lineage of theorists from across a broad spectrum who identified the link

between art and the mind (Onians, 2007, esp. p.7-17). In describing the recent emergence of 'neuroarthistory' Onians quotes Norman Bryson in acknowledging the demise of Poststructuralist thought or the semiotic paradigm with its 'clerical outlook' that reduces artefacts to discourse texts (Onians, 2007, p.1). Two important points need to be made here. First, the way art historians and other writers describe the operation of art may not necessarily parallel the way artists describe their work as research (after all, we have very little precedent for such descriptions by artists). Secondly, the recent neuroscience motivated focus on the cognitive nature of art making and reception, most notably by Barbara Stafford (2007), does not necessarily mark a distinctive severing with semiotic analysis which is often oversimplified to an absolute reduction of meaning and subjectivity to a system of symbolic codes.

For example, three decades ago, Nelson Goodman's *the Languages of Art* was considered a founding text, exemplifying the epistemic turn towards a semiotic analysis of image and text. However Goodman's attitude to understanding art as a 'cognitive' activity can be framed in ways that are not at all incompatible with Onians or Stafford's views. Indeed, they may offer a bridge between the use of neuroscience and aesthetics. Reflecting on *Languages of Art* and writing ten years after their jointly published *Reconceptions* (1988), Goodman's co-author, Catherine Elgin would claim:

The job of aesthetics is to explain how. Such a contention would be capricious if epistemology were construed as the theory of knowledge. Rarely are the arts repositories of justified true beliefs. But knowledge, Goodman and I contend, is unworthy to be our ultimate cognitive objective. Far better to set our sights on understanding. And far better for epistemology to treat understanding as the focus of its concern (Elgin, 1997, p.63).

Goodman and Elgin would not be surprised that the concordance analysis privileges descriptions of visual art with the terms 'metaphor' and 'demonstrate/ion' since they contend that art operates as a form of metaphoric exemplification. Exemplification also plays a key role in empirical science but metaphorical reference is excluded from almost all forms of scientific inquiry. As Carlo Ginzberg pointed out, all knowledge that requires for its operation a judgment based on carefully observed cumulative events or sequenced objects will follow 'the narrative axis of metonymy, with the rigorous exclusion of metaphor' (Ginzburg, 1986, p.103).

Given the preliminary findings, it would be most useful, and certainly feasible, to repeat this process with a significant sample of five hundred similarly de-identified research statements submitted for the ERA 2010 process. A concordance of such a

sample compared to that of an equal number of science abstracts would lend itself to much more comprehensive and definitive conclusions. In other words, such a study of studio research would belie the quote from Shakespeare that forms my title.

 3 noted. Groundwater levels and water quality were analyzed to assess the impacts of urbanization on the Zah  
 4 between- and within-home variance components were analyzed. Endotoxin levels in kitchen floor and bedroom f  
 5 edish samples did not differ. Multiple regression analysis revealed a significant effect of age on levels of  
 6 s bronchioles. Results of histologic and particle analysis of respiratory bronchioles indicated a highly sig  
 7 ing chalcopyrite. The results of leached residues analysis indicated that composition of leaching minerals c  
 8 r light scattering instrument. Cream samples were analyzed immediately after funnel separation and treated  
 9 after funnel separation and treated samples were analyzed right after incubating prior to centrifugation.  
 10 incubating prior to centrifugation. Phospholipid analysis was performed on the soybeans, freeze-dried fract  
 11 ed of oxygen and calcium, while the energy counts analysis indicated a significant increase in the presence  
 12 ere investigated. Carbohydrates and proteins were analyzed by the phenol-sulfate method and Lowry method, r  
 13 ty of Basrah and the University of Washington, we analyzed Ibn Ghazwan Hospital's leukemia registry data to  
 14 for the study. The total glutathione levels were analyzed in the saliva of smoking and non-smoking patient  
 15 latent trajectory model (ALT), which permits the analysis of both persistent individual differences in beha  
 16 of oral lichenplanus. We apply latent transition analysis (LTA) to characterize transitions over time in su  
 17 Carlo facilitates the implementation of Bayesian analyses. Despite the complexity of the model, our approac  
 18 zed and identified by the purity grade, elemental analysis, the positions and numbers of substituents, absor  
 19 This extends the potential of neutron activation analysis in solving scientific and practical problems. Th  
 20 3C-nuclear magnetic resonance (NMR) regiospecific analyses of triacylglycerols to distinguish fish oils from  
 21 red to the two other species. Principal component analysis of data points in the carbonyl-region showed that  
 22 the carbonyl region of 13C-NMR spectra. 31P NMR analysis of samples prepared in a sodium cholate detergent  
 23 P NMR. However, 31P NMR is more suited to routine analysis, with sample analysis taking 36 min. The method w  
 24 R is more suited to routine analysis, with sample analysis taking 36 min. The method was also more versatile  
 25 in. The method was also more versatile and sample analysis was possible on high phospholipid containing mate  
 26 light scattering detection was developed for the analysis of oils and fats, which enabled excellent separat  
 27 he mobile phase and temperature on separation and analysis time were evaluated with a cocoa butter standard.  
 28 five consecutive days, and oils were sampled for analysis. The results obtained from the chemical tests dem  
 29 den chemical markers based on the results of fuel analysis by gas-liquid chromatography with sample preevapo  
 30 use of a special computer software built into the analyzer. The results of determining palladium(II) in raw  
 31 depending on the conditions of their synthesis is analyzed. A simple, rapid and reliable method was develo  
 32 als from lubricating oil samples followed by FAAS analysis. Aqueous standard solutions can be easily employe  
 33 e plate. Such a combination decreases the time of analysis and increases the separation efficiency with resp

34 of planar chromatography. The method was used to analyze liquid kerosene pyrolysis products obtained using  
 35 mplex under the conditions of step-wise injection analysis. The analytical range for mercaptane sulfur was f  
 36 coveries in the range of 97-102% were obtained by analysis of spiked real samples. The method was successful  
 37 rb, respectively. The procedure was tested in the analysis of a urine sample from a healthy human with addit

1 can be an important source of nutrients to them. Compared with anadromous salmonids on the West Coast, East  
 2 andheld cellular telephone users in Singapore and compared with those who did not use these handheld telepho  
 3 t symptom among handheld cellular telephone users compared with nonusers. No association was found between t  
 4 in the first-generation respiratory bronchioles, compared to second-generation respiratory bronchioles, as  
 5 nchioles, as well as changes in second-generation compared to third-generation respiratory bronchioles. Pigm  
 6 carbon, calcium and oxygen on the fouled membrane compared to the new anion-exchange membrane (AMX), as well  
 7 ificant ( $P=.03$ ). Basrah's childhood leukemia rate compared unfavorably with neighboring Kuwait and nearby Om  
 8 nsa show similarities as well as differences when compared with other species of Testudines. To gain an und  
 9 y higher in subject of periodontitis in smoker as compared to non-smoker and salivary total glutathione conc  
 10 y increased in patients with oral lichenplanus as compared to controls ( $P<0.01$ ). Among the LDH isoenzymes, L  
 11 n the treatment of hematologic diseases. However, compared with marrow or mobilized peripheral blood stem ce  
 12 side triphosphates available for DNA replication. Compared with its precursors, clofarabine has an increased  
 13 ic properties of carbons and other adsorbents are compared. The purposeful regulation of the chemical nature  
 14 er proportion of its 22:6n-3 in the sn-2 position compared to the two other species. Principal component ana  
 15 y and two proposed methods of peak separation are compared. A procedure was developed for sample preparatio  
 16 ation by gas chromatography-mass spectrometry are compared. It has been found that the ultrasonic treatment

1 use behavior as a categorical latent variable are demonstrated. Alcohol use (any drinking and binge drinking)  
 2 ly straightforward to implement using WinBUGS. We demonstrate our joint modeling approach to the combined dat  
 3 d solid malignancies. Since then, clofarabine has demonstrated single-agent antitumor activity in pediatric an  
 4 . Proof-of-principle experiments in animal models demonstrate the efficacy of exogenous stem cells in mediatin  
 5 sis. The results obtained from the chemical tests demonstrated that used frying oil had lower polar compounds,

1 aboration with Stanford faculty and students were described. The objective was to provide an idea of the mix

 5 , rapid and reliable method was developed for the determination of copper, nickel, iron and lead in fresh and us  
 6 veloped method was effectively applied to routine determination of Cu, Ni, Fe, and Pb in lubricating oil samples  
 7 (PAHs) from coal tar pitch for their quantitative determination by gas chromatography-mass spectrometry are  
 compa  
 8 m coal tar pitch. The results of the quantitative determination of PAHs in samples of coal tar pitch obtained by

omated procedure is developed for the photometric **determination** of mercaptanes in air. To achieve the required s  
r. To achieve the required selectivity of analyte **determination**, a scheme of sample preparation was elaborated,  
e formation of ternary complex was applied to the **determination** of trace Cr(VI) in water samples. The method is  
pled with spectrophotometric detection allows the **determination** of chromium at  $\mu\text{g}$  levels. The chemical variables  
ed and optimised. The proposed method allowed the **determination** of chromium(VI) in the range 5–100  $\mu\text{g/L}$  with goo  
mples. The method was successfully applied to the **determination** of chromium in various water samples. An HPLC p

s, intrabone delivery of HSCs, modulation of CD26 expression, and infusion of two UCB grafts. This article mal lens signal generation are considered, and an expression is derived to relate the detected signal (a re

among rockfish species should be considered when interpreting any measures of condition. Multiple stable re

cher, an excellent biologist, and a fine man. We investigated developmental changes in the body compositions an aqueous extraction of extruded soybean flakes was investigated. The oil droplet size distribution in the cream e tant produced by *Gordonia* sp. strain JE-1058, was investigated. Scale-up fermentations were performed in the 300 the culture supernatant. Biosurfactants were also investigated for their efficacy in removing hydrocarbons from gestion of kitchen garbage and excess sludge were investigated. Carbohydrates and proteins were analyzed by the access for prisoners increased. Objectives. We investigated whether, over time, baseline obesity is associate ds 22:6n-3, 20:5n-3 and 18:4n-3 among the species investigated. The most pronounced difference was that herring ed from two industries processing soybean oil was investigated for its physicochemical characteristics, its comp ative light scattering detector output signal was investigated by means of a response surface experimental desig L/min. Finally, the linearity of the detector was investigated. It was found that at very low concentrations, th nges in the quality indices of used oil have been investigated. To achieve this, potato slices were fried in bot ence of concomitant ions on the CPE of Cr(VI) was investigated. Recoveries in the range of 97-102% were obtained

on of modern wheat varieties and dissemination of **knowledge** on planting dates and timings of inputs. Urine s

We conclude that some metabolically important FAs may prove useful in assessing the condition of embryo  
essively into large-scale official systems, which may later be privatized. In other vases, foreign capi  
te. The findings suggested that methylation of As may not be strictly a detoxification process for huma  
1 studies have suggested that periodontal disease may be an independent risk factor for preeclampsia an  
E , and tumor necrosis factor alpha (TNF-a) which may have systemic effects i.e. adverse effect in preg  
5 dominated in whole saliva samples. Salivary LDH may be a feasible and useful parameter for screening  
t the studies are homogeneous, thus the estimates may be biased due to unobserved heterogeneity among s  
terol (3.1%) and campesterol (50.1%). The product may find use in foods, pharmaceuticals, cosmetics and

and proteins were analyzed by the phenol-sulfate method and Lowry method, respectively. The degree of solubilization of choline in a jail to examine the feasibility of this method of providing condoms to jail prisoners. After the or the majority of lines produced by the standard method of spectrum processing. This extends the potential sodium cholate detergent system was assessed as a method for the quantitative measurement of dairy phospho

(SM) and dihydrosphingomyelin (DHSM). The  $^{31}\text{P}$  NMR method was validated by comparison with a quantitative t analysis, with sample analysis taking 36 min. The method was also more versatile and sample analysis was p ed FFSF. A high performance liquid chromatography method with evaporative light scattering detection was d nols, and steryl ferulates. Deep fat frying is a method of food preparation which has been popular for qu y microwave as an alternative to the conventional method of frying has become popular in recent years. In thesis is analyzed. A simple, rapid and reliable method was developed for the determination of copper, ni elative standard deviation of 2-6%. The developed method was effectively applied to routine determination onventional methods of planar chromatography. The method was used to analyze liquid kerosene pyrolysis pro termination of trace Cr(VI) in water samples. The method is based on the formation of a purplish red compl hodology were studied and optimised. The proposed method allowed the determination of chromium(VI) in the obtained by analysis of spiked real samples. The method was successfully applied to the determination of are then considered from the standpoint of future methodological development and substantive theoretical c ecting the analytical performance of the combined methodology were studied and optimised. The proposed met nvestigations where he conducted studies into the methods of preserving fish and other aquatic products. T ens of M. gouazoubira were prepared following the methods normally used in anatomy. The epaxial muscles an e exclusion chromatography (HPSEC) and extraction methods using buffers containing SDS and 2-mercaptoethan ically oxidized at almost the same potential. Two methods were proposed for the separation of overlapping ore using stripping voltammetry and two proposed methods of peak separation are compared. A procedure wa ation efficiency with respect to the conventional methods of planar chromatography. The method was used to

bonaceous and mineral dust in the lungs and the remodeling of the small airways along the same airway pat rcumference, Methods. We used latent growth curve modeling to examine data from years 5, 10, 15, and 20 o ic approach, the autoregressive latent trajectory model (ALT), which permits the analysis of both persist ct relationships. The present study utilizes this modeling approach with a sample of 524 offenders releas ults of the analytic process suggest that the ALT model fit the data well. Comparatively, that model fit ALT model fit the data well. Comparatively, that model fit better than the autoregressive or LGC specifi ifications and provides more information. The ALT model provides estimates that are relevant in understan among first-year college students. Advantages of modeling substance use behavior as a categorical latent r, we introduce a Bayesian framework that jointly models survival data using a Weibull proportional hazar survival data using a Weibull proportional hazard model with frailty, and substance and alcohol data usin nd substance and alcohol data using mixed-effects models, to examine differences in mortality among heroi Bayesian analyses. Despite the complexity of the model, our approach is relatively straightforward to im implement using WinBUGS. We demonstrate our joint modeling approach to the combined data and discuss the liative. Proof-of-principle experiments in animal models demonstrate the efficacy of exogenous stem cells ndicators. Approaches to adjustment of numerical models for gamma-ray spectra of matrix elements are con spectra, (3) the improvement of agreement between model and actually observed spectra using the compariso ation of the test electrolyte is determined for a model electrolyte (NaCl), and sensitivity characteristic

rea over the same period, a rise of about 3 m was observed. Even with rationing of groundwater, water is not st pronounced relative impact of fish consumption observed for 2,2',4,4'-tetrabromodiphenyl ether. The plasm rical conductivity and ion-exchange capacity were observed for both membranes. The results showed that depos

acidogenic fermenters, were also measured. It was **observed** that differences in temperature, hydraulic retent  
 il prisoners. After the machine was installed, we **observed** increases in prisoners' awareness of programmatic  
 sequent estimates to calculate rates. Results. We **observed** 698 cases of childhood leukemia between 1993 and  
 eneous, thus the estimates may be biased due to **unobserved** heterogeneity among studies. Our approach allows  
 provement of agreement between model and actually **observed** spectra using the comparison test for peak amplit  
 ensitive, able to detect some minor compounds not **observed** by <sup>31</sup>P NMR. However, <sup>31</sup>P NMR is more suited to ro  
 llular disruption of the cotyledon cells was only **observed** for extruded FFSF. Extrusion and HPP at 500 MPa f  
 ile of the extracted proteins were, however, only **observed** for the enzyme-treated 500-MPa FFSF. Optimal oil  
 n JS. No difference in fatty acid composition was **observed** between DJS and JS. The protein content was not s  
 y acids than sunflower oil. The interesting point **observed** was that peroxides formed as the result of oxidat

iated with the analyses, night sharks are still a **relatively** common species. Information from the pelagic lo  
 from those of hatched larvae. Differences in the **relative** abundances of FAs between early embryos and hatch  
 elaware Bay oyster population is characterized by **relatively** low abundance, an unremarkable rate of recruitm  
 w abundance, an unremarkable rate of recruitment, **relatively** low natural mortality, and a spatial distributi  
 tion of the stock on the medium-mortality beds is **relatively** low in comparison with the 54-yr median of 0.41  
 eased probability of high mortality occurs over a **relatively** small range of total abundances. It is also con  
 nal fish meal per month, with the most pronounced **relative** impact of fish consumption observed for 2,2',4,4'  
 oor concentrations and size distribution appeared **relatively** similar across microenvironments. Within indoor  
 isease, through its association with increases in **relative** weight and abdominal obesity over time. Objecti  
 pite the complexity of the model, our approach is **relatively** straightforward to implement using WinBUGS. We  
 5% for Fe, 96–106% for Ni and 84–100% for Pb with **relative** standard deviation of 2–6%. The developed method  
 ssion is derived to relate the detected signal (a **relative** change in probing radiation intensity at the dete

suffered large magnitudes in decline. The results **show** that the U.S population of night sharks is highly  
 liarity to their population dynamics. The results **show** that an increased probability of high mortality o  
 ltic Sea fish, mainly salmon and herring. Results **showed** that, except for pentachlorophenol, the plasma  
 of each individual was examined. Almost no lungs **showed** visible evidence of disease, but approximately  
 f disease, but approximately half of the subjects **showed** histologic evidence of smoking-related lung inj  
 ges (AMDs) of several chalcopyrite mines in China **showed** strong capacity of bioleaching chalcopyrite. Th  
 e (PE) and phosphatidylinositol (PI). The results **showed** that the industrial adoption of soybean oil ext  
 ity were observed for both membranes. The results **showed** that deposit was composed of oxygen and calcium  
 owing hydrocarbons from sand or soil. The results **showed** that JE1058BS could be used for the dispersion  
 d their compositions in the acidogenic fermenters **showed** considerable change, depending on the temperatu  
 . Chemical oxygen demand (COD) removal efficiency **showed** large variations during the experimentation and  
 lity of the leachate characteristics. The results **showed** that the COD removal efficiency was approximate  
 paratus, the dentary, coronoid and supra-angular, **show** ossification centers in stage 16 and the branchia  
 and synchronization of ossification in *P. expansa* **show** similarities as well as differences when compared  
 rvical, thoracic, lumbar and sacrocaudal segments **showed** an average length of 175.07, 226.03, 123.47 and  
 d. The kinetic studies of ion-exchange adsorption **showed** that two limiting stages of transfer, namely, d  
 calculated from the carbonyl region. The results **show** that there were significant differences in the sn

18 nt analysis of data points in the carbonyl-region showed that there were also differences in the level a  
 19 f oil samples matrix. Percentage recovery studies showed 88–98% for Cu, 92–95% for Fe, 96–106% for Ni an  
 20 to 7.5 ?g/m<sup>3</sup> for a sample volume of 1 m<sup>3</sup>. It was shown that changes in the absorption band intensities

1 tic status. FA profiles of early embryos differed significantly from those of hatched larvae. Differences in th  
 2 ed subjects, respectively. The incidence differed significantly, however, when four ETS exposure categories wer  
 3 vels in kitchen floor and bedroom floor dust were significantly higher than in dust from beds. Mean bed endotox  
 4 dotoxin computed for each home was not correlated significantly with mean bedroom or kitchen floor endotoxin, b  
 5 nd kitchen floor endotoxin levels were correlated significantly. None of the mean dust endotoxin measurements w  
 6 e mean dust endotoxin measurements was correlated significantly with mean airborne endotoxin. Airborne endotoxi  
 7 ative correlations with temperature, but none was significant, whereas a total-home mean dust endotoxin level w  
 8 tal-home mean dust endotoxin level was associated significantly and negatively with wet-bulb temperature. Airbo  
 9 the winter. Indoor airborne endotoxin levels were significantly higher than outdoor levels during the winter, b  
 10 s of all organohalogen substances were correlated significantly to estimated fish consumption. In addition, age  
 11 t differ. Multiple regression analysis revealed a significant effect of age on levels of total PCBs, 4,4'-DDE,  
 12 ons and the size distributions appeared to differ significantly. Higher indoor levels, particularly for smaller  
 13 with the prevalence of headache, but there was a significant positive trend for increasing time spent on the h  
 14 phone and prevalence of headache, and there was a significant negative trend for prevalence of headache with in  
 15 sis of respiratory bronchioles indicated a highly significant difference in the degree of histologic changes fo  
 16 ium, while the energy counts analysis indicated a significant increase in the presence of carbon, calcium and o  
 17 led over a 15-year period. The test for trend was significant (P=.03). Basrah's childhood leukemia rate compare  
 18 he treatment without aquatic plants (control) was significantly lower than in the treatment with E. najas. Howe  
 19 s: Total glutathione of saliva were statistically significantly higher in subject of periodontitis in smoker as  
 20 nd salivary total glutathione concentrations were significant reduced following scaling and root planning in sm  
 21 very of low birth weight infants (PLBW) remains a significant public health issue and a leading cause of neonat  
 22 ght babies. Inflamed periodontal diseases produce significant amounts of pro-inflammatory cytokines, mainly int  
 23 d (salivary LDH3, LDH4, LDH5) and in subunit were significantly increased in patients with oral lichenplanus as  
 24 the honors program, and friendship goals were all significant predictors of substance use behavior profile. St  
 25 ipheral blood stem cell grafts from adult donors, significant delays in the rates and kinetics of neutrophil an  
 26 re of carbon adsorbent surfaces is considered; it significantly extended the gas-chromatographic capabilities o  
 27 carbonyl region. The results show that there were significant differences in the sn-2 position specificity of t  
 28 d between DJS and JS. The protein content was not significantly different between JS and DJS. However, DJS had  
 29 ased. The deterioration process in jojoba kernels significantly affects the chemical quality of their proteins  
 30 h-oleic sunflower oil, but at levels of 0.1–1% it significantly increased the OSI for stripped soybean, sunflow

1 management areas and U.S. domestic subareas are studied. The currently available information on the genet  
 2 ic disorder in women of reproductive age. In this study, the association between environmental tobacco sm  
 3 eported in 77% of the menstrual cycles of the 165 study subjects, and the average daily exposures ranged  
 4 fish consumption, age, and country of origin. The study group provided a large interindividual contrast i  
 5 pital, museum, restaurant, store, and subway. The study was conducted in Boston, MA. Collectively, the ou  
 6 se these handheld telephones. The cross-sectional study was conducted in a housing estate containing a su

h reactor treating sanitary landfill leachate was studied. Two nitrification tests were carried out during Coronary Artery Risk Development in Young Adults study (n =4643). We assessed depressive symptomatology nsity functional theory calculations are used for studying radially deformed and defective single wall (8 ergy and applied force. The experiment aimed to study the influence of the aquatic plants E. najas, P. itis in non-smokers (n=13) were recruited for the study. The total glutathione levels were analyzed in th study stage-specific direct relationships. The present study utilizes this modeling approach with a sample of of substance use and crime. The purpose of this study was to determine the usefulness of salivary lacta s for screening of oral lichenplanus. The present study included a total 35 subjects (10 oral cancer: 25 untng for correlation among subjects within each study. Markov chain Monte Carlo facilitates the impleme oside phosphorylation. In 1993, the first Phase I study was initiated in patients with hematologic and so etraphenylborate to drotaverine hydrochloride was studied. The composition of a polymeric membrane was opti and the flow of ions through the interface, were studied. Linear correlations between the solubility of io subtracted from the spectra of the samples under study. Thus, additional analytical lines are obtained f ientific and practical problems. The aim of this study was to use <sup>13</sup>C-nuclear magnetic resonance (NMR) r l products. It was found that the two DOD samples studied were dark in color and had higher amounts of free a nutraceutical. The objectives of the present study were to determine how extrusion (barrel temperatu uality of damaged and undamaged jojoba seeds. The study was performed on jojoba seeds grown in La Rioja, ipped sunflower oil during an accelerated storage study conducted at 60 C was also determined. DDGD (0.5- sorption spectrophotometry (FAAS). In the present study, a mixture of organic solvents containing propion e. The capabilities of critical chromatography to study the amino acid sequences in biopolymer, peptide, ical performance of the combined methodology were studied and optimised. The proposed method allowed the de

Atlantic blue marlin, white marlin, and sailfish suggests an absence of within-Atlantic divergence, suppor etic population structure is indiscernible. It is suggested that while minimal mixing is apparent, it does 2,3-dimercapto-1-propane sulfonate. The findings suggested that methylation of As may not be strictly a de al and microbiological immunological studies have suggested that periodontal disease may be an independent ly adulthood. The results of the analytic process suggest that the ALT model fit the data well. Comparative ttenuating fibrotic responses to injury, but also suggest that their ability to contribute to lung epitheli sing buffers containing SDS and 2-mercaptoethanol suggested that noncovalent interactions were the main for

ion agent for use in the remediation and toxicity tests. The biosynthesis of the biosurfactant was monit landfill leachate was studied. Two nitrification tests were carried out during the experimental period srah more than doubled over a 15-year period. The test for trend was significant (P=.03). Basrah's child nd actually observed spectra using the comparison test for peak amplitudes of matrix elements, and (4) s d after the subtraction of matrix elements in the test samples. The adjustment allows the contribution o opherols, tocotrienols, and carotenoids. DDGD was tested for its impact on the oxidative stability index analysis. The results obtained from the chemical tests demonstrated that used frying oil had lower pola e applied voltage and on the concentration of the test electrolyte is determined for a model electrolyte I, PTU, and Carb, respectively. The procedure was tested in the analysis of a urine sample from a health

ford University that provided the solid basis for understanding of regional fish faunas in parts of the Pacific red with other species of Testudines. To gain an understanding of the detailed anatomical aspects of Mazama g

3 ALT model provides estimates that are relevant in understanding key parameters of the substance use and crimin
