## (2-Bromophenyl)diphenylphosphine

The crystal structure of (2-bromophenyl)diphenylphosphine, $\mathrm{C}_{18} \mathrm{H}_{14} \mathrm{BrP}$, (I), has been determined at 295 (1) K. The structure of (I) is isomorphous with the analogous methyl compound (2-methylphenyl)diphenylphosphine.

## Comment

(2-Bromophenyl)diphenylphosphine, (I), has been shown to coordinate to metal centres as both a monodentate ligand through the P -donor atom, and as a chelating hemilabile ligand through both the phosphine and the aryl bromide donor groups (Burk et al., 1988). The solid-state structure of (I) is isomorphous with the structure reported for (2-methylphenyl)diphenylphosphine, (II) (Bowmaker et al., 1987).

(I)

The structure consists of discrete molecular species which adopt a propeller-shaped conformation with the phenyl rings twisted away from the normal to the base of the $\mathrm{PC}_{3}$ pyramid by 36,27 and $53^{\circ}$ [cf. (II): 36,26 and $47^{\circ}$. The bromide is located cis to the phosphorus lone pair. The $\mathrm{P}-\mathrm{C}$ bond lengths [mean value 1.836 (6) Å] are similar to those recorded for triphenylphosphine [mean value 1.831 (2) $\AA$; Dunne \& Orpen, 1991], while the mean value of the $\mathrm{C}-\mathrm{P}-\mathrm{C}$ bond angles, $101.9(8)^{\circ}$, is marginally smaller than the value of $102.8(5)^{\circ}$ observed for triphenylphosphine. Introduction of the bromo substituent on ring 1 in (I) results in a small increase in the $\mathrm{P}-\mathrm{C} 11-\mathrm{C} 12$ angle to $119.8(3)^{\circ}$ compared to 117.1 (3) and $116.4(3)^{\circ}$ for $\mathrm{P}-\mathrm{C} 21-\mathrm{C} 22$ and $\mathrm{P}-\mathrm{C} 31-\mathrm{C} 32$. The corresponding angles in triphenylphosphine are 116.6 (1), 116.8 (1) and $117.5(1)^{\circ}$. The molecules are linked in the crystal lattice through edge-to-face $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions between the phenyl groups (Scudder \& Dance, 1998). In accord with previous studies demonstrating the poor hydrogen-bond acceptor properties of $\mathrm{C}-X$ bonds (Aullón et al., 1998), there is no evidence of significant $\mathrm{C}-\mathrm{H} \cdots \mathrm{Br}$ intermolecular interactions in (I), with the shortest $\mathrm{H} \cdots \mathrm{Br}$ distances being greater than $3.1 \AA$.

## Experimental

The title compound was obtained as a white crystalline powder from the $\mathrm{PdCl}_{2}\left(\mathrm{CH}_{3} \mathrm{CN}\right)_{4}$-catalysed reaction between ortho-bromoiodobenzene and diphenyl(trimethylsilyl)phosphine (Tunney et al., 1987); m.p. 386-388 K. Crystals of the compound suitable for X-ray diffraction studies were obtained during an attempt to recrystallize the $1: 2$ copper(I) bromide complex by diffusion of ether into a solution of the complex in dichloromethane.
